

MILESTONE HODL TOKEN

\$MHT

Market cap growth, converted into holder rewards, by contract.

WHITEPAPER V3 — 15 September 2026

Network	BNB Smart Chain — ChainID 56
Total supply	1,000,000,000 MHT — fixed, no mint function
Buy tax / Sell tax	0% / 0%
Ownership	Renounced at launch — owner() = address(0), config locked
Contract	0x4fb46E8630094F34D96B409EC1713793aD19b734
Deployed	14 September 2026

This document describes the V3 contract deployed on 14 September 2026. It supersedes every previous version of this whitepaper, which described the V2 contract.

I. ABSTRACT

Milestone HODL Token (\$MHT) is a BEP-20 token on BNB Smart Chain built around a single mechanism: half of the total supply is locked in a vault inside the contract, and a fraction of that vault is released to holders each time the market capitalisation crosses a new one-million-dollar level. The crossing is proven by an on-chain time-weighted average price, not asserted by anyone.

There is no tax on buying or selling, no marketing cut taken from the releases, and no privileged address anywhere in the protocol. Ownership of the token contract and of the liquidity custodian was renounced at launch, and the configuration is locked. Nothing in this document depends on the team continuing to act, continuing to pay for a service, or continuing to exist.

That last sentence is the whole design, and it is the reason V3 exists.

II. WHY V3 EXISTS

The V2 contract used Chainlink Automation to trigger milestone releases. The address recorded in the contract as the authorised caller was the Chainlink registry address, whereas in the Automation model the call arrives from a forwarder. The check never passed, and because the setter was owner-only and ownership had already been renounced, it could never be corrected. The vault worked exactly as written; it simply could not be reached.

The lesson was not that the code was wrong. It was that a mechanism which depends on one privileged caller has a single point of failure, and renouncing ownership turns any such mistake into a permanent one. V3 removes the privileged caller entirely.

In V3, the milestone check is a public function. Anyone can call it — a holder, a bot, a passer-by. Security no longer comes from restricting who calls; it comes from what the function reads: a thirty-minute time-weighted average price, confirmed three times over two hours. Restricting the caller was never security. It was a dependency.

The same principle was applied throughout. No external automation service. No subscription to renew. No admin key. No pausing. No blacklist. No anti-whale transfer limit. No tax logic to maintain.

III. THE MILESTONE ENGINE

The vault holds 500,000,000 MHT inside the token contract itself. Each time the market capitalisation crosses the next one-million-dollar level, the contract releases 5% of whatever remains in the vault, with a floor of 1,000,000 MHT and a cap of 20,000,000 MHT per milestone. Because the cap binds while the vault is large, the first six milestones each release exactly 20,000,000 MHT.

Parameter	Value
First milestone	\$1,000,000 market cap
Increment	+\$1,000,000 per milestone
Release	5% of the remaining vault balance
Floor / cap per milestone	1,000,000 MHT / 20,000,000 MHT
Distribution	100% to eligible holders, pro-rata — no split
Cooldown	24 hours between two milestones
Price source	PancakeSwap V3 on-chain TWAP, 30-minute window
Confirmations	3 readings, 10 minutes apart, within a 2-hour window
Trigger	pokeMilestone() — public, callable by anyone

Parameter	Value
Claim	claimRewards() — any time, never expires

Why three confirmations

A single price reading, even a time-weighted one, can be pushed by a large trade. Requiring the threshold to hold across three readings taken ten minutes apart means a manipulator would have to sustain an artificial price for a significant period, against arbitrage, at their own cost. The pool is also required to carry a minimum observation cardinality of 4,500 before the oracle is considered ready, so the thirty-minute window is always backed by real history.

How rewards reach holders

When a milestone fires, each eligible holder is credited pro-rata to their balance at that exact block. The credit is held for them in the contract. It does not expire, and selling the tokens afterwards does not remove it — the reward follows the person, not the tokens. Holders call claimRewards() whenever they wish.

IV. HOW MARKET CAP IS MEASURED

This is the structural choice of V3, and it is the opposite of what aggregators display.

Data aggregators show Fully Diluted Valuation: price multiplied by the total supply of one billion tokens. The contract instead multiplies the price by the eligible supply — the tokens that someone has actually paid for. Four categories are excluded:

- the vault, held by the contract itself
- the migration reserve, until a V2 holder burns and claims
- the burn address
- the tokens still sitting unsold in the liquidity pool

Tokens still in the pool have been paid for by nobody. Counting them would inflate the market cap with capital that does not exist and would fire milestones too early. Under the eligible-supply rule, market cap rises exactly as fast as the market absorbs tokens. The same reasoning applies to the migration reserve: those tokens enter the measure at the precise moment a holder migrates, and whatever is never claimed is burned, so it never has to be counted at all.

The practical consequence is that aggregators will display a figure roughly twenty times larger than the one the contract reads. Both are arithmetically correct; they answer different questions. Only the contract's figure can arm a milestone.

A second consequence is favourable to holders and worth stating plainly: eligible supply grows with every migration and every purchase, so the price required to reach the next milestone decreases over time on its own.

V. TOKENOMICS

Allocation	Amount	Share and destination
Smart-Vault	500,000,000 MHT	50% — locked in the contract, released only by milestone
Liquidity	431,527,050.75 MHT	43.15% — 6 bands + BNB safety band, held by the custodian
Founder	50,000,000 MHT	5% — locked until 14 September 2027, no early

Allocation	Amount	Share and destination
		release
Migration reserve	18,256,306.25 MHT	1.83% — provisioned for V2 holders
Launch burn	216,643 MHT	0.02% — sent to the burn address at launch
Total	1,000,000,000 MHT	100% — fixed at deployment, no mint function exists

There is no marketing allocation in V3. Nothing is taken from milestone releases, and no share of trading is diverted to a treasury. The founder allocation is held by a dedicated custodian contract with a hard-coded unlock date and no early-release function; it cannot be moved before that date by anyone, including the founder.

VI. LIQUIDITY

Liquidity was placed at launch as seven concentrated positions on PancakeSwap V3 — six MHT bands spread across a price range, plus one BNB safety band. The positions are owned by a custodian contract that has no withdraw function of any kind. There is no timelock to expire and no key to trust: removal is not restricted, it is absent from the code.

Ownership of that custodian was also renounced, on 14 September 2026. Its only remaining privileged action had been the ability to change the recipient of the pool's swap fees; with ownership renounced, that recipient is now fixed forever. As of that date there is no privileged address anywhere in the protocol.

Property	Value
Venue	PancakeSwap V3, 0.25% fee tier
Pool	0x5BB24C4f0Be106AEaEF18841ADd3944E9F1f60Ab
Positions	6 MHT bands + 1 BNB safety band
Held by	Liquidity custodian — no withdraw function
Custodian ownership	Renounced 14 September 2026

VII. MIGRATION FROM V2

A snapshot of every V2 holder was taken on 14 September 2026, immediately before deployment, and written into the migration contract. There is nothing to claim and nothing to prove: a holder burns their V2 tokens and receives V3 in the same transaction, with a bonus that decreases over three windows.

Window	Deadline (UTC)	Bonus
First window	4 November 2026, 13:21	+25%
Second window	4 March 2027, 13:21	+10%
Third window	4 September 2027, 13:21	+5%
After	—	Migration closed permanently

Whatever remains unclaimed in the migration reserve when the window closes is burned. It was never part of the eligible supply, so its removal changes no holder's share of anything.

Note for migrating holders: after migration your wallet shows a zero V2 balance, because those tokens were burned. V3 is a different contract and most wallets will not display it until it is added manually — contract 0x4fb46E8630094F34D96B409EC1713793aD19b734, 18 decimals, BNB Smart Chain.

VIII. SECURITY AND AUDIT STATUS

Property	Detail
Ownership	owner() and pendingOwner both address(0) since launch
Configuration	Locked — setConfig() can no longer be called
Privileged addresses	None remaining anywhere in the protocol
Mint	No mint function exists
Tax	None — no fee logic in the transfer path
Blacklist / pause	Neither exists
Transfer limits	None
Re-entrancy	Guard on pokeMilestone(), claimRewards() and rescue paths
Oracle	30-minute TWAP, minimum observation cardinality 4,500
Compiler	Solidity 0.8.36, optimizer 200 runs
Verification	All five contracts verified on BscScan; registry also on Sourcify

Audit status, stated precisely

The V3 contracts were put through static analysis and fuzzing before deployment — Slither, Mythril, Aderyn, Echidna and Wake — and every finding was reviewed. A tick-boundary bug was caught by a mainnet-fork test during that campaign and fixed before launch, which is what those tools are for.

The SolidProof audit scored 85.36/100 with KYC, and it covers the V2 contract, not this one. No independent third-party audit of V3 has been completed at the date of this document. One is planned and appears in the roadmap. Readers should weigh the protocol on what can be verified today: the source is public and verified on BscScan, ownership is renounced, the configuration is locked, and no privileged address remains.

IX. CONTRACT INFORMATION

Contract	Address
\$MHT V3 (token)	0x4fb46E8630094F34D96B409EC1713793aD19b734
Migration V2 → V3	0x99E56011439534918146da8A90a8280561fcc13A
Liquidity custodian	0x6519Fa7f6eC51082b6f028134dd67a01B284942C
Founder custodian	0x78ed4b690EC1690D1808D7A1fa2833ebbeA3D5FE
Metadata registry	0x15D723Fd27b18a14E5f6a476553859022135153d
PancakeSwap V3 pool	0x5BB24C4f0Be106AEaEF18841ADd3944E9F1f60Ab
\$MHT V2 (legacy)	0x22E0fcEc929c4F38c8D8c03B2B2F225E98F133fa
Burn address	0x00000000000000000000000000000000dEaD

On-chain metadata

The token's logo, description and official links are published on-chain in a public registry contract, in a structured format any indexer can read. The logo is referenced by content address on Arweave rather than by a URL, so it cannot be silently swapped after the fact. The record is frozen: the registry only accepts writes from the token's owner, and since ownership is renounced, no further change is possible by anyone.

Lineage

The link between V2 and V3 is itself on-chain: a transaction sent from the V2 deployer wallet establishes the relationship publicly, so the succession does not rest on this document.

X. ROADMAP

Phase	Content	Status
Phase 1	Genesis — V1 and V2, SolidProof audit and KYC, PancakeSwap launch	Completed
Phase 2	V2 lesson — external automation dependency identified as a single point of failure	Completed
Phase 3	V3 deployed 14 September 2026 — ownership renounced, on-chain TWAP, 0% tax, migration open	Live
Phase 4	First milestones \$1M → \$10M, aggregator coverage, independent third-party audit	Upcoming
Phase 5	\$25M → \$100M+, recurring payouts, exchange listings, wider ApexPad ecosystem	Upcoming
